

# VIGIL — AI DETECTION EVIDENCE REPORT

EVENT REFERENCE ID: #VIGIL-DC8792DC // CLASSIFICATION: POTENTIAL THREAT

|            |                                                                     |                     |                               |
|------------|---------------------------------------------------------------------|---------------------|-------------------------------|
| Status:    | VIOLENCE DETECTED                                                   | Confidence:         | 3.3%                          |
| Timestamp: | 2026-09-14 06:22:12 UTC                                             | Decision Threshold: | 0.70                          |
| Source:    | Uploaded File: test_upload.mp4                                      | Clip Duration:      | 4.5 Seconds                   |
| Model:     | VIGIL ViolenceCNNLSTM v2.0<br>(MobileNetV2 + 2-Layer Temporal LSTM) | Verification:       | Temporal Hysteresis Confirmed |

AUTOMATIC EVIDENCE FRAME CAPTURES:

Evidence Frame 01 (Initial Kinetic Onset)

Evidence Frame 02 (Peak Altercation Moment)

SPATIAL-TEMPORAL PROCESSING PIPELINE:

Video sequences are processed through MobileNetV2 spatial feature extraction coupled with inter-frame kinetic motion divergence descriptors (1,344-dim fused representation). A 2-layer temporal LSTM with sequence dropout evaluates dynamic physical trajectories across a 16-frame sliding window. The alert is validated using multi-frame temporal hysteresis to eliminate false positives from benign fast movement.

IMPORTANT DISCLAIMER:

This document records the automated output of an AI-based video analysis system. AI predictions may contain false positives and false negatives. The result is not definitive legal proof of violence and should be reviewed by a qualified human operator before taking administrative or security action.
